

ReactCV App Summary

Evidence source: src/, public/, package.json, scripts/download-qna-model.js

What It Is

A React + TypeScript + Vite portfolio web app for Martin Borba with interactive ML demos. Built with Material UI, plus downloadable CV/scholarship PDFs and browser-side AI features.

Who It's For

Primary persona: recruiters, hiring managers, and technical peers evaluating profile and skills.

What It Does (Key Features)

- Personal landing page with profile content and light/dark theme toggle.
- One-click download buttons for resume and scholarship PDFs from /public.
- Webcam face-mesh game with mouth-open detection and score tracking.
- TensorFlow QnA assistant answering questions from a configurable passage.
- Sample quick questions plus free-text chat input UI.
- Webcam YOLOv8 object detection with confidence-threshold slider and box overlay.

How It Works (Repo-Based Architecture)

- Entry flow: src/main.tsx mounts App; App.tsx wires MUI theming and renders MBorba + footer.
- MBorba composes feature components: GameCam, BertChat/Chat, and CICam/CIDetectionCam.
- Static model/assets served from /public: face_mesh, ci_detection_modelv3, qna_model.
- Chat path: Chat.tsx loads @tensorflow-models/qna (local model first, CDN fallback).
- Face game path: GameCam.tsx gets webcam stream, estimates landmarks, updates game state.
- CV detection path: CIDetectionCam.jsx loads GraphModel; detect.js runs per-frame inference.
- Backend/API services: Not found in repo (no server-side app code detected).

How To Run (Minimal)

- npm install
- Optional if qna model is missing: npm run download-qna-model
- npm run start
- Open the local Vite URL and allow webcam access for the demos.
- Node/npm version requirement: Not found in repo.
